

Game Objective

H2gO! is a semi-cooperative game played in pairs.

The goal of the game is to reach the end of the path before the other pairs. The first pair to reach the finish line wins. But be careful not to run out of water too soon!

Game Rules

- Each player must choose a token and a partner to collaborate with in order to win;
- At the beginning of the game, each player receives 1 technology card and a certain amount of water resources based on the total number of players:
- After receiving the technology card, each player must decide which of the two technologies described on the card to use and place the card face up, showing the chosen technology;
- The amount of water resources is:

Number of players	Water resources per player
4	18
6	15

- Turns go clockwise. On each turn, the player rolls a die and moves along the path based on the number shown. To move, however, the player must spend an equivalent number of water resources.
Example: if I roll a 4, I can advance 4 spaces but must return 4 water resources to the box.
- If the number rolled is higher than the water resources available (e.g., I roll a 4 but only have 3 water resources), the player can:
 - Move forward the number of spaces allowed by the resources they have (in the example, move 3 spaces);
 - Skip their turn;
 - Borrow water resources from their partner and move forward the full number of spaces shown on the die.
- Along the path, players may land on **technology spaces**, marked with one or two wells, or **climate spaces**, marked with illustrations of the four climate scenarios.
- Every time a player lands on a technology space, they draw a card from the "Technologies" deck, read aloud the two available technologies, and choose one to use.
- After the 3rd technology, any additional technologies can only be used by spending 3 water resources, which are returned to the box;

- Once a technology is chosen, it cannot be changed during the game!
- Every time a player lands on a climate space, they draw a card from the "Climate" deck, read aloud the effects, which apply to **all players**, not just the one who drew the card!
- Extreme weather events, **flood** and **drought**, cause all players to lose water resources. If a player doesn't have enough water to handle the event, they can:
 - Borrow water resources from their partner;
 - Destroy one of their technologies (player's choice).
- When a player lands on a **ladder space**, they may advance to the space indicated by the ladder **without using water resources** if they correctly answer a randomly drawn question from the designated deck.
 - If the player doesn't know the answer, they may be helped by their partner;
 - **Warning!** The ladder from space 16 to 18 is the only one that can also be used in reverse (from space 18 back to 16).
- From space 18 onward, if a player runs out of water resources, they can move forward **one space at a time** (without rolling the die and without using water!) by correctly answering one question. They can continue moving forward during the same turn as long as they keep answering correctly, but upon answering incorrectly, they must stop and end their turn.
 - In this case, they **cannot** be helped by their partner!

Question List

- What technologies are effective in the rain?
- What technologies are effective in the sun?
- During a flood, are there both gains and losses of water resources?
- During a drought, are there both gains and losses of water resources?
- If a flood comes after a drought, is more or less water lost?
- If a drought comes after a flood, is more or less water lost?
- What activities can you do at home to save more water?
- To use less water for irrigating fields, what can we do at work?
- Can cooling water from machines be reused?
- What is the name of the water hidden inside clothes and products?

- Why are parks useful in reducing flood damage?
- Why are parks useful in reducing drought damage?
- How much water would we save by repairing all the pipes in Italy?
- What are rain gardens?
- Which technologies make you gain the most water resources? (Home, Work, or City)
